

The following instructions recreate an approximation of a LEGO Pikachu tail gift sent to influencers in celebration of the launch of the LEGO Pokémon theme in March 2026.

Because the original model was glued down it's not possible to view the exact building techniques used for most of this build, but the tail is (almost) identical to that found in LEGO 72152 Pikachu and Poké Ball, so the instructions for that set can be used as a reference if these instructions are unclear. The only difference is a couple of 1 x 1 bricks in the brown base of the tail.

The suggested build for the black base of this model is merely a suggestion, and there are probably neater and tidier ways to assemble it. The stud width and depth as well as all external bricks should be accurate, but there is some leeway to experiment with the inner construction.

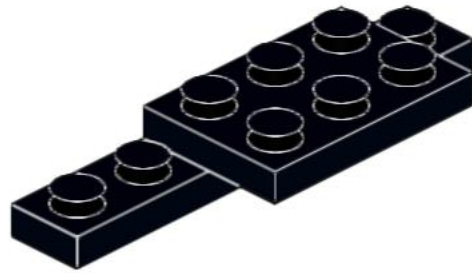

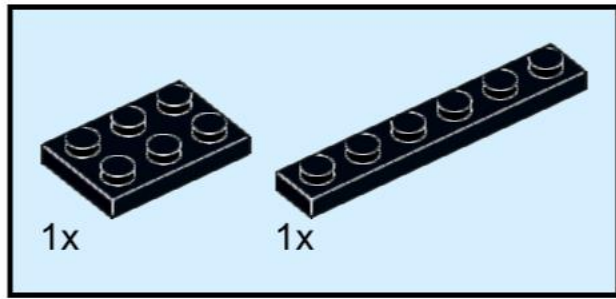

The one part of this build that is radically different to the original source material is the manner in which the tail attaches to the black base. In the original model, a yellow Technic cross axle is used, and is visible underneath the base, however, it's unclear how this attaches to the tail. In this build, a slightly clumsy solution has been used, but there are probably plenty of better alternatives to this design, so feel free to experiment.

For the sake of ease, the yellow axle has been changed to a more widely available black 4L axle; again, there is room here to experiment, so please don't take these instructions as the definitive way to construct this build.

Hopefully these instructions will be relatively easy to follow, and hopefully you enjoy the finished build.

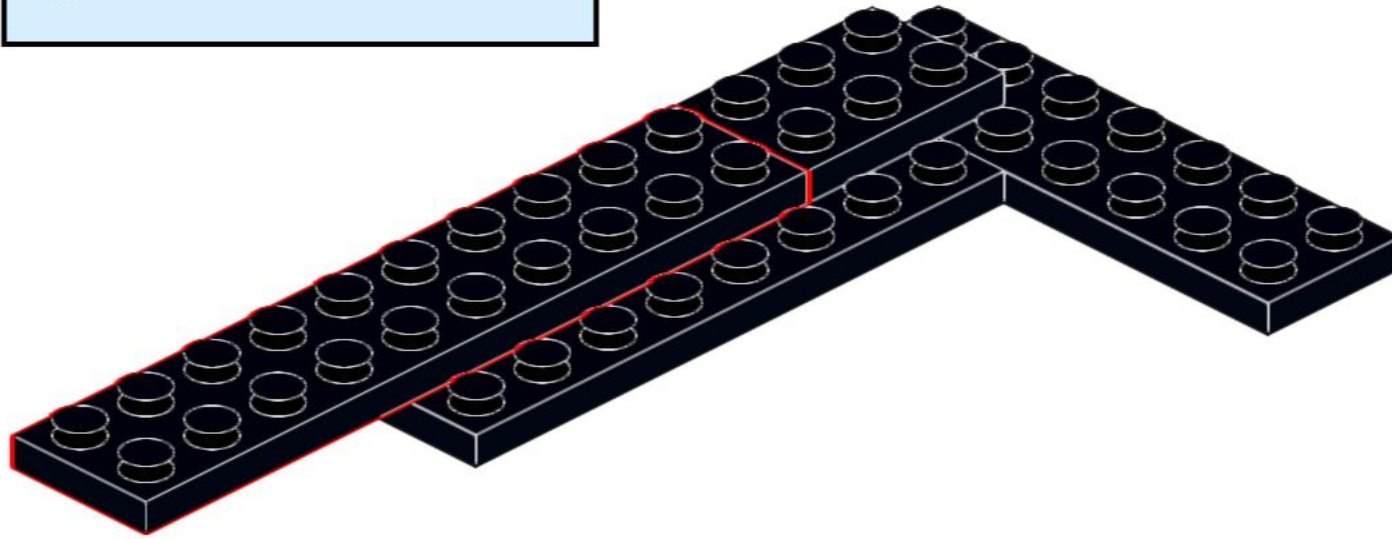

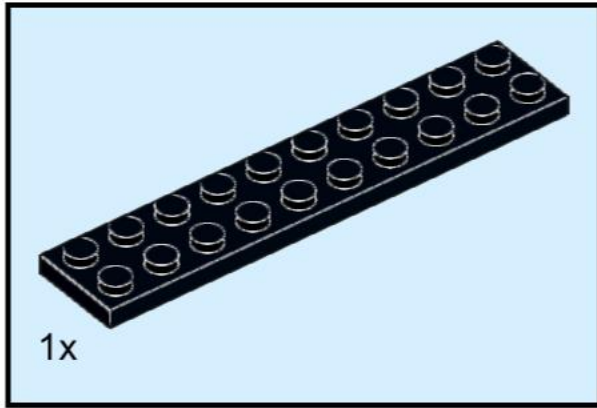

This version 2.0 of these instructions features minor edits for stability as well as a clearer build flow and the inclusion of a parts list at the end.
